

I Jerry Alexander application no. 10/068,095 publication no.
20020136026 cancel claim 1 and I claim (Claim 2):

I Claim

2. An illuminating device comprising an illuminating film sandwiched between two panels, said illuminating film connected to a microchip/program chip to display numbers and letters:

a illuminating film operated by a mother board, two or four way wire connections that allows connection to be made via an electrical circuit;

fabricating the film into any shape or size glass panels does constructions for final product;

the end resolution is a display of any programmable message using numbers and letters inside the glass;

this is achieved by the mother board with data input and data output, circuit, memories and other components that process the information to the films.
